

Harsh Narwariya		Performance Appraisal System -Lead Feedback							
From		1-Apr-2025							
To		31-Mar-2026							
Level		II							
Role		Software Developer							
Manager		Sahil Talreja verified By Siddharth Osatwal							
A	TECHNICAL DELIVERY	OKR Defined	Measures to achieve the defined goals	RM Expectation	Self-OKR Achieved	Self Scores	Lead-OKR Achieved	Lead Scores	Org Manager - score
1	Technical Knowledge	Master Key Technologies: Gain deep expertise in technologies like React, Express, Prisma, Firebase, Tailwind CSS, closures, prototypes. server-side rendering (SSR) and static site generation (SSG) with frameworks like Next.js	Work on projects using TypeScript to get comfortable with type definitions Follow tutorials on React and Next.js Follow tutorials to build RESTful APIs or GraphQL services with Express.js Learn about Firebase for real-time data syncing and push notifications	Using TypeScript, Next.js, RESTful APIs, and GraphQL services with Express, a single project with a POC and code base too must be created.js additionally incorporates Firebase to sync data in real time with push alerts. The code library should be used to upload it. The project start time should also be shortened by 60%.	I successfully completed full-stack development using Next.js, integrating GraphQL for efficient data management and implementing RESTful APIs to ensure scalable and structured backend communication. Additionally, I gained hands-on experience in implementing push notifications using Firebase Cloud Messaging (FCM) and integrating web services to enhance real-time user engagement.	8	Demonstrates strong working knowledge of modern frontend technologies, including TypeScript, React/Next.js, and API integrations. Shows good understanding of component architecture and state management. To meet senior-level expectations, one should deepen expertise in performance optimization, advanced patterns (such as SSR/ISR strategies), and	8	8
2	Research & Self-learning Skills	Regularly learn about new tools, libraries, frameworks, and technologies in the IT industry Become an expert in a specific technology or framework to add value to your skillset Keep up with the latest trends in the IT industry, including automation, AI, cloud computing, etc	Use platforms like GitHub, Stack Overflow, or product hunt to discover new tools. Evaluate libraries by checking documentation, reading reviews, and testing them in small-scale projects. Compare libraries and frameworks to assess their advantages and limitations in your use case.	Proper documentation should be created for the learning. Standard process should be created which would increase the productivity by 40%. Should informed about the market trends and technology which should reflect that.	Evaluated multiple libraries by reviewing documentation, community feedback, and implementing small-scale proof-of-concept projects. Mostly worked on tanstack: https://tanstack.com/ Explored Github Actions and CI/CD Pipelines. Contributed on stackoverflow with questions and answers regarding PROBLEMS	8	Actively explores new tools and libraries and evaluates them before implementation. Shows initiative in learning through documentation and hands-on practice. To move to the next level, the company expects the individual to formalize learnings into reusable documentation, share insights with the team, and influence tech stack decisions based on research	8	7 [1]
3	Problem Solving Skills	Learn how to break down complex problems into smaller, manageable parts for easier analysis and solution finding. Understand how to design efficient algorithms and optimize them for performance Learn which data structures are best suited for different types of problems and how to apply them effectively Develop the ability to recognize common problem patterns and apply appropriate solutions or algorithms	Practice breaking down problems into smaller, manageable steps by writing pseudocode or drawing diagrams before coding Learn common algorithms (sorting, searching, dynamic programming) and practice implementing them in various languages Learn to use debugging tools like breakpoints and console logs to identify issues in your code Practice identifying edge cases (e.g., empty arrays, large numbers, null values) and consider them while designing solutions.	Aa a experienced developer you should be capable of debugging and troubleshooting bugs in written code and frameworks. You should also be able to write clean, modular, and maintainable code, handle edge cases, integrate APIs, find efficient solutions under deadlines, learn from mistakes, and collaborate in problem-solving. This includes balancing speed and code	Improved problem-solving skills by consistently breaking down complex problems into smaller, manageable steps and using pseudocode before implementation. Gained hands-on experience in debugging and troubleshooting issues using tools such as breakpoints and console logs, which helped identify and resolve bugs more efficiently. Also collaborated with developers to build effective solutions to problems	9	He can independently analyze problems and provide effective solutions, showcasing strong logical reasoning and debugging skills. For senior level, the focus should shift to addressing complex, ambiguous challenges, enhancing current solutions, and anticipating potential issues proactively.	8	7 [2]
4	Technical Design	Learn how to design systems that can scale efficiently with growing traffic and data while remaining maintainable over time. Study and apply software design patterns (e.g., Singleton, Factory, Observer) to solve common problems in your codebase. Understand the pros and cons of microservices vs monolithic architecture and when to use each based on project requirements. Learn how to design efficient databases (relational and NoSQL) that are optimized for	Study cloud architectures and best practices (e.g., AWS, Google Cloud, Azure) for scaling applications Read books like Design Patterns: Elements of Reusable Object-Oriented Software by the Gang of Four, and Clean Architecture by Robert C. Martin. Study the differences between microservices and monolithic architectures, and learn how to break down a monolithic app into microservices Study normalization, denormalization, indexing, and query optimization for relational databases like MySQL or PostgreSQL	He has limited experience in utilizing advanced technologies in deployment designs, such as container orchestration tools like Kubernetes or advanced CI/CD pipelines, as he mentioned. Should be able to create technical document and proceed.	Studied software design principles from resources like Design Patterns and Clean Architecture, and developed awareness of how to structure maintainable code. Learned key database concepts such as normalization, indexing, and query optimization for relational databases like MySQL and PostgreSQL. Got introductory exposure to	7	Harsh understands basic design principles and has started exploring scalable system design. However, experience in defining frontend architecture is still evolving. As a frontend developer, should take ownership of designing scalable, maintainable UI architectures and contribute to high-level design discussions	6.5	6 [3]
5	Attention to detail	Learn to review your work with an eye for minor mistakes, inconsistencies, or areas where improvements can be made. Understand the importance of consistent code formatting, naming conventions, and commenting practices to ensure clarity and readability Learn how to spot small inconsistencies in user interfaces and ensure that all design elements follow the style guide. Understand the importance of clear, concise, and	Conduct thorough self-reviews before submitting code, focusing on both logic and formatting Follow coding style guides for your language or framework (e.g., Airbnb's JavaScript style guide, PEP 8 for Python) Use design tools (e.g., Figma, Sketch, Adobe XD) to ensure that every element of the UI adheres to the style guide Set aside time to review your work for small bugs or errors that may have been overlooked during	Focused vision, Train own skill to notice patterns or inconsistencies.	Improved code quality by performing self-reviews before submission, focusing on logic, readability, and formatting. Developed the habit of identifying small bugs and edge cases by allocating time for final checks before completing tasks. Writing clearer and more structured documentation to explain code logic and	8	Maintains good code quality through self-reviews and testing. Pays attention to functionality and UI behavior. Moving forward, should consistently ensure pixel-perfect UI, cross-browser compatibility, accessibility, and edge-case handling expected at a senior level.	7	7

6	Coding, Productivity & Timely Delivery	Learn how to write clean, optimized, and reusable code that minimizes debugging time and speeds up development. Learn how to effectively manage your time and prioritize tasks to ensure timely delivery without sacrificing quality. Master the use of Git and other version control systems to avoid merge conflicts, manage branches efficiently, and collaborate seamlessly with teammates. Familiarize yourself with development tools, libraries, and frameworks that accelerate coding and improve productivity	Follow coding best practices such as writing modular, DRY (Don't Repeat Yourself) code. Break down tasks into smaller, manageable pieces and tackle them one at a time to prevent overwhelming yourself. Use time management techniques like the Pomodoro Technique, time-blocking, or the Eisenhower Matrix to stay focused on high-priority tasks	Extensive use of AI and increase in productivity by 40% Should be able to manage the task with more efficiency	Effectively used GitHub Copilot to speed up routine coding tasks, generate boilerplate code, and explore alternative implementations Observed noticeable improvement in development speed, especially for repetitive and boilerplate tasks Applied basic time management techniques to stay focused on high-priority tasks and complete work more efficiently.	9	Delivers tasks efficiently and leverages tools like GitHub Copilot to improve productivity. He should focus on improving code reusability, reducing technical debt, enforcing coding standards across the team, and mentoring others to improve overall productivity.	8	9
B	PERSONAL ATTRIBUTES & WORKING STYLE								
1.1	Communication & Interpersonal Skills	Learn how to articulate ideas, technical concepts, and project requirements in a clear and understandable way for both technical and non-technical audiences. Develop active listening skills to fully understand what others are saying, which leads to better responses and more efficient problem-solving. Learn how to work effectively in teams, contribute constructively to discussions, and support colleagues to achieve common goals	Practice explaining technical concepts in simple terms to non-technical colleagues or clients Focus on understanding what others are saying before responding, and ask clarifying questions if needed Pay attention to verbal and non-verbal cues (e.g., body language, tone) to better understand the emotions of others Participate in group projects or team activities to improve your ability to collaborate effectively.	There must be team communication. It's your responsibility as a frontend developer to make sure that new employees create strong relationships with you and your teammates.	Practiced active listening by focusing on understanding requirements clearly and asking relevant clarifying questions before implementation. Handled discussions around tasks and requirements more calmly and professionally, improving overall team communication	8	Harsh has ensured requirements are fully understood before execution. He should proactively drive technical discussions, articulate complex frontend concepts to non-technical stakeholders, and ensure alignment across teams.	7.5	7 [4]
1.2	Organizing Skills	Learn how to identify the most important and urgent tasks and tackle them first, ensuring critical work is completed on time Master time management techniques to effectively plan and allocate time for each task to avoid delays and ensure efficiency Learn how to set clear, actionable goals and create detailed plans to accomplish them,	Use techniques like the Eisenhower Matrix (urgent vs. important) or ABC prioritization to categorize tasks based on urgency and importance Implement time management strategies like the Pomodoro Technique, where you work in focused intervals followed by short breaks, to enhance productivity Use SMART goals (Specific, Measurable, Achievable,	Make sure to use task align with or without the managment tool also streamline complex task dependencies.	Managed task dependencies more effectively by aligning work based on priority and sequence, ensuring smoother execution even without relying heavily on management tools	8	He demonstrates an ability to prioritize tasks based on urgency and sequence, effectively managing complex dependencies even when working outside of formal management tools. Harsh should optimize task	7.5	7.5
1.3	Sincerity / Commitment / Flexibility / Reliability	Learn to always be truthful, transparent, and straightforward in your interactions with colleagues, clients, and stakeholders Develop a strong work ethic and sense of responsibility towards ensuring high-quality work and meeting deadlines Learn to embrace change and stay adaptable to new processes, requirements, or challenges that	Practice being open about your thoughts, challenges, and limitations. If you make a mistake, acknowledge it openly and take responsibility Set personal standards for work quality, ensuring that your output always reflects your best effort. Stay open-minded about new ideas, processes, or feedback that may require you to change your approach Cultivate habits like time management and organization	Develop a strong work ethic, strong work ethic, adaptability to change, and dependable behavior to ensure high-quality work, meeting deadlines, and meeting expectations.	Adapted to changes in requirements, feedback, and processes with a positive and flexible approach Demonstrated honesty and transparency in day-to-day work by openly communicating progress, challenges, and limitations when required	9	He has proven to be a highly dependable developer who takes full ownership of his tasks. His transparency regarding project challenges and his flexibility in adapting to changing requirements have been key to recent project	9	9
1.4	Taking Initiative & Ownership	Learn to recognize how your tasks and responsibilities fit into the overall project or company goals, and be proactive in ensuring alignment Develop the ability to identify tasks or areas of improvement that have not been assigned but are essential to the project's success Cultivate a mindset of identifying problems early on and taking action to resolve them, rather than waiting for someone else to take charge	Regularly communicate with team leaders and stakeholders to understand the overarching goals of the project Actively observe areas where your input could make a difference, even if they haven't been specifically assigned to you. Instead of waiting for issues to escalate, look for early signs of potential problems and take action to address them Hold yourself accountable for both the outcomes of	Ought to begin offering suggestions and ideas for enhancing and introducing new procedures within the company. focusses on strategic project selection, cultivates an accountable culture, leads frontend projects, and coaches colleagues to enhance their working methods.	Made initial efforts to contribute ideas for improving workflows and development practices within the team Took initiative to identify small improvements and gaps in tasks, and contributed suggestions where applicable.	7	He is open to feedback and collaborates effectively with backend and QA teams. As a frontend developer, he is expected to enhance cross-team collaboration, assist teammates, and promote a collaborative engineering culture.	7.5	7
1.5	Positiveness & Self Motivation	Learn to stay optimistic even when facing setbacks, viewing challenges as opportunities for growth rather than obstacles Develop techniques to keep yourself motivated, even when tasks are repetitive, difficult, or when facing a lack of external encouragement Build emotional resilience to bounce back from disappointments, stress, or negative feedback, maintaining focus on long-term goals	Practice gratitude by writing down things you are thankful for every day to shift focus toward the positive Set clear personal goals and create a vision of success to keep yourself motivated even when external motivation is low Practice mindfulness techniques like meditation or deep breathing to help manage negative emotions and stay focused under pressure Engage in regular physical activity (e.g., exercise, yoga,	Improve handling negativity, inspire others, and reflect on challenges to avoid dismissiveness of important issues.	Maintained a positive and balanced mindset while handling day-to-day challenges and work responsibilities Stayed motivated and consistent & Handled feedback and setbacks in a constructive manner	9	He maintains a balanced and optimistic mindset, particularly when handling constructive feedback or technical setbacks. This attitude has a positive ripple effect during high-pressure phases.	9	9
C	FIRM DEVELOPMENT & LEADERSHIP								

1	Firm Development	Learn to align your personal goals with the larger vision and mission of the firm, ensuring that every action contributes to the firm's overall growth and success Understand that firm development goes beyond your immediate responsibilities and requires you to step up and take action in areas outside your usual scope of work Learn the importance of teamwork and collaboration to achieve the larger objectives of the firm, understanding that your individual contributions impact the broader organization Foster a mindset of continuous improvement by regularly looking for innovative ways to improve workflows, increase efficiency, and create value for the firm	Regularly engage with the firm's leadership and stakeholders to understand the broader goals of the company. Volunteer for projects or initiatives that contribute to the firm's development outside your immediate job description, such as process improvements, team-building activities, or internal workshops	Volunteer for initiatives like internal workshops, team-building exercises, or process enhancements, and interact with stakeholders and company leadership to comprehend overarching objectives.	Showed willingness to support tasks or initiatives beyond core responsibilities when required Developed better understanding of the organization's goals by staying aligned with team discussions and overall project direction.	7	Harsh has demonstrated strong alignment with the organization's long-term goals. When necessary, he handles basic interactions with clients and communicates updates effectively. He also occasionally provides guidance to his colleagues when needed. He should organize knowledge-sharing sessions and contribute to onboarding and skill development within the team.	7	6.5 [5]
---	------------------	--	--	--	--	---	--	---	---------

[1] Learning Should be aligned with company's vision and project pipeline.

[2] Sonar cube implementation pending,
On L2 should start providing suggestion instead of just finishing assigned work.

[3] Haven't seen any application architecture design should start focusing on that.

[4] At his level he need to learn to explain stuff as per the audience and scope.

[5] Start giving suggestion on improving the process.
